

Please renumber pages 22-26 of the original application papers containing the claims as pages 14-18.

In the Abstract:

Please insert the Abstract of the Disclosure attached herewith into the specification as page 19.

REMARKS

The foregoing amendments are presented to place the application in compliance with the sequence rules under 37 CFR 1.821-1.825.

Applicants have submitted a Sequence Listing in both paper and computer readable form as required by 37 C.F.R. 1.821(c) and (e). Amendments directing its entry into the specification have also been incorporated herein. The content of the paper and computer readable copies are the same and no new matter has been added.

The specification has also been carefully reviewed and editorial changes have been effected. All of the changes are minor in nature and therefore do not require extensive discussion. Specifically, the specification headings have been amended in conformance with U.S. practice.

Applicants have also prepared and filed a new Abstract Of The Disclosure based on the Abstract from the International application.

Also, the additional sequences disclosed in Figure 6 of the specification have been incorporated into the new Sequence Listing and labeled in the Brief Description of the Drawings (see Appendix A) in accordance with U.S. practice.

Attached hereto is a marked-up version of the changes made to the specification and claims by the current amendment. The attached page is captioned "Version with markings to show changes made."

In view of the foregoing, it is believed that each requirement set forth in the Notice has been satisfied, and that the application is now in compliance with the sequence rules under 37 CFR 1.821-1.825. Accordingly, favorable examination on the merits is respectfully requested.

Respectfully submitted,

Tamas LUKACSOVICH et al.

A Vector for Gene Trap, and A Method for Gene Trapping

TECH CENTER 1600/2900

by Using The Vector

5

Background of the Invention

1. Technical Field of the Invention

The present invention relates to a new vector system to facilitate the cloning and functional analysis of new genes of a fly, *Drosophila melanogaster*, and a method for gene trapping with the vector system.

2. Description of the Related Art

Background Art

There are numerous examples for application of gene trapping methods in wide range of living organisms including maize and mouse (Gossler et al., *Science*, 244:463-465, 1989).

With respect to tools for gene trapping, the application of different types of enhancer trap P-element vectors (Wilson et al., *Genes & Development*, 3:1301-1313, 1989) for cloning and analyzing trapped genes, as well their use for mosaic analysis with the help of the Gal4/UAS transcription activator system has proven fruitful. However, sometimes the expression pattern of the Gal4 or other reporter gene of the vector construct is affected by enhancers belonging to more than one gene. Similarly, in some cases it is difficult to determine whether the enhancer trap insertion effects the function of one or more of the neighboring genes.

These circumstances altogether with the fact that in some cases the mutant phenotype could be attributed to the

changed expression of a gene with its nearest exon located more than 30 kB apart from the insertion site, can lead in unfortunate cases to an ordeal when it's time to clone and analyze the affected gene.

5 One object of this application is to provide a vector system that includes specifically designed artificial regulatory sequences as well as selection methods for easy screening of positive recombinant lines. More especially, this application intends to provide a vector system of this
10 invention offering much easier and faster cloning opportunities of the affected gene, compared to the widely used enhancer trap P-element vectors. Another object of this application is to provide easier detection method possibilities of the successful trapping events and much
15 higher chance to get more characteristic ("functional") expression patterns of the reporter gene because in the contrary with much of the cases with enhancer trap lines, when using the vector system of this invention, the reporter gene expression is influenced only by a single endogenous
20 transcription unit and effects only the expression of the very same gene.

Summary of the Disclosure of Invention

The first invention of this application is a vector for
25 trapping an unknown gene of *Drosophila melanogaster*, which is a recombinant plasmid comprising the following nucleotide sequences in this order:
an artificial consensus splicing acceptor site;
a synthetic "stop/start" sequence;
30 a reporter gene;

(b) selecting primary transformants for the vector A which are resistant to the drug, and selecting primary transformants for the vector B which have an eye color;

5 (c) crossing the primary transformants for the vector A with a transposase source strain to force the vector to jump into other locations;

(d) selecting secondary transformants for the vector A by picking up the flies having strong eye color;

10 (e) crossing the secondary transformants with the primary transformants for the vector B to obtain flies harboring both the vectors A and B;

15 (f) crossing the flies obtained in the step (e) with an UAS-luciferase harboring fly strain and measuring the reporter gene expression of the resultant flies after a heatshock treatment; and

(g) identifying the trapped gene by cloning and sequencing the cDNAs fused to the reporter gene and the gene responsible for a detectable phenotype of the fly.

20 Embodiments of the second and third inventions are corresponded to the embodiments of the first invention, and they will be more precisely described in the following description.

25 *me*
Brief Description of Drawings

Figure 1 shows the schematic map of the vector of this invention, pTrap-hsneo.

Figure 2 shows the schematic map of the vector of this invention, pTrap-G4-p53.

30 Figure 3 shows the schematic map of the vector of this

invention, pCasperhs-G4-LT.

Figure 4 shows the schematic map of the vector of this invention, pTrap-G4-luc.

Figure 5 shows the schematic drawing of a fly genome to which the vector of this invention is inserted for cloning.

Figure 6 shows the results of sequencing RT-PCR products of aop-Gal4 and m-white-aop fusion mRNAs.

Figure 7 presents pictures of characteristic beta-galactosidase staining patterns in different parts of the fly brain resulted from crossing positive gene trap lines with flies harboring a UAS-lacZ construct.

Description of the Preferred Embodiments Best Mode for Carrying Out the Invention

A vector construct of the first invention, for example, can be based on the commonly used, P-element transformation vector, pCasper3 (Pirotta, *Vectors: A survey of molecular cloning vectors and their uses*, eds. Rodriguez, R.L. & Denhardt, D.T., Butterworths, Boston. 437-456, 1998) and the convenient Gal4-UAS expression system (Brand and Perrimon, *Development*, 118:401-415, 1993).

A promoterless Gal4 gene preceded by an artificial consensus splicing acceptor site and a synthetic "stop/start" sequence to govern the read through translation coming from upstream exon(s) of the trapped gene into the proper reading frame of Gal4 was inserted into the polycloning site of pCasper3.

The removal of the whole 3' UTR (untranslated region) sequence of the mini-white gene and replacement by an artificial splicing donor site resulted in a truncated gene without its own poly-adenylation site.

Without a successful gene trapping event this truncated mini-white gene was not expected to confer any eye color, therefore in this invention a heatshock promoter directed neomycin-phosphotransferase (hs-neo) gene for helping 5 selection of primary transformants by antibiotic feeding has been inserted.

Figure 1 shows the schematic map of the gene trap construct (pTrap-hsneo), and SEQ ID No.1 is the complete nucleotide sequence of the vector pTrap-hsneo.

10 Another gene trap construct, pTrap-G4-p53 (Figure 2) is created by replacing the Gal4 coding sequence of plasmid pTrap-hsneo with a Gal4 DNA binding domain-P53 fusion gene (Clontech, Matchmaker Two Hybrid System, #K1605-1). When this construct coexists in the genome of the same fly with another 15 vector, pCasperhs-G4-LT (Figure 3) containing a heatshock promoter directed Gal4 activator domain-large T antigen (Clontech, Matchmaker Two Hybrid System, #K1605-1) fusion gene, the assembly of a functional Gal4 molecule, through p53-large T antigen interaction, can be regulated by external 20 heatshock.

In this way, the possibility of an intentional temporary control of Gal4 activity ~~became~~ ^{becomes} available. In other words, the Gal4 expression in a pattern as already determined spatially by the promoter of the trapped gene now can be 25 induced at any desired stage of development by external heatshock.

In order to make the detection of Gal4 expression easier, the Gal4 gene in another construct is replaced with a Gal4-firefly luciferase fusion gene to get pTrap-G4-luc 30 (Figure 4). This artificial gene is coding for a fusion

terminator) instead of its removed ones. They are the most likely candidates for successful gene trap events. In case of these lines the vector probably has been inserted either into an intron of a gene or upstream from the first intron into 5 the 5' UTR in proper orientation (that is the direction of transcription is same for the "trapped gene" and the mini-white (and Gal4) genes as well). The mini-white gene has its own promoter therefore its expression pattern is supposed to be largely independent from that of the trapped gene.

10 These positive lines are to be checked in the next step for Gal4 expression by crossing them with a "marker" line harboring a UAS-luciferase reporter gene construct. (When using pTrap-G4-luc vector, this step is obviously not necessary.) Usually very strong correlation was found between 15 eye color and Gal4 expression: more than 90% of the lines having strong eye color proved to be expressing Gal4 by means of luciferase assay using luminometer (Brandes et al., *Neuron*, 16:687-692, 1996).

20 (2) Cloning:

When the gene trap construct is being inserted into an intron of an endogenous gene, the marker genes of the construct are supposed to be spliced ^{at} mRNA level to the exons of the trapped gene by using the artificial splicing 25 acceptor and donor sites. More exactly while the Gal4 mRNA should be ^{joined} to the exon(s) located upstream of the insertion site, at the same time the mini-white mRNA is fused to the following exon(s) accomplishing the dual tagging of the trapped gene (Figure 5).

30 This feature can be used for quickly and easily

by changed expression of gene(s) disturbed by insertion of the P-element. The rescue can be made by expressing the cDNA of the suspected gene most preferable with identical spatial and temporary pattern than that of the gene itself.

5 As it was expected, the vector constructs of the first invention usually cause strong phenotypes. It's not surprising at all because the trapped genes are supposed to be split into two parts on mRNA level resulting in null mutants in majority of the cases. Accordingly mutants 10 obtained by this method frequently show homozygous lethality or sterility. Hypomorphic mutants can be obtained by forcing imprecise excision of the gene trap P-element construct.

As mentioned above, the Gal4 expression is obliged to reflect precisely to that of the trapped gene simply because 15 the Gal4 gene has ^{not} its own promoter and they share a common, fused mRNA.

This identical expression provides unique opportunity to rescue the mutant phenotype by crossing this fly with another one harboring the UAS directed, cloned cDNA of the 20 trapped gene.

25 ^{In} this way either the original, homozygous null mutant gene trap fly or any transheterozygous derivative of that with some hypomorphic allele over the null mutant allele can be rescued.

25

(4) Determination of spatial and developmental expression pattern of the trapped gene:

Histochemical determination of the spatially and temporarily controlled expression of any trapped gene is also 30 easy following introduction of a UAS-lacZ construct into the

particular nucleotides of the artificial regulatory sequences where it was expected.

On Figure 7, there are pictures of characteristic beta-galactosidase staining patterns in different parts of the fly 5 brain resulted from crossing positive gene trap lines with flies harboring a UAS-lacZ construct.

Industrial Applicability

The vector system of this invention offers an 10 exceptional opportunity for easy and fast cloning of the gene responsible for the observed phenotype. Furthermore, by using the UAS-driven coding sequence of any gene of interest, that particular gene can be expressed in identical patterns than those of the trapped genes and these expressions can be 15 regulated temporarily at any desired developmental stage.

CLAIMS

What is claimed is:

1. A vector for trapping an unknown gene of *Drosophila melanogaster*, which is a recombinant plasmid comprising the following nucleotide sequences in this order:
 - 5 an artificial consensus splicing acceptor site;
 - a synthetic "stop/start" sequence;
 - a reporter gene;
 - a drug resistance gene;
 - 10 a gene responsible for a detectable phenotype of the *Drosophila melanogaster*; and
 - a synthetic splicing donor site.
2. The vector of claim 1, wherein the recombinant plasmid
15 is derived from pCasper3.
3. The vector of claim 1 or 2, wherein the reporter gene
is the Gal4 gene.
- 20 4. The vector of claim 3, which has the nucleotide sequence of SEQ ID No. 1.
5. The vector of claim 1 or 2, wherein the reporter gene
is Gal4 DNA binding domain-P53 fusion gene.
- 25 6. The vector of claim 1 or 2, wherein the reporter gene
is the Gal4-firefly luciferase fusion gene.
7. The vector of any one of claims 1-6, wherein the gene
responsible for a detectable phenotype of the *Drosophila melanogaster* is mini-white gene.
30

8. The vector of any one of claims 1-7, wherein the drug resistance gene is neomycin-phosphotranspherase gene and its promoter is a heatshock promoter.

5

9 A vector derived from pCasperhs, which has the heatshock promoter directed Gal4 activator domain-large T antigen fusion gene within polycloning site of the pCasperhs.

10 10. A method for trapping an unknown gene of *Drosophila melanogaster* by using a vector which is a recombinant plasmid comprising the following nucleotide sequences in this order: an artificial consensus splicing acceptor site; a synthetic "stop/start" sequence; a reporter gene; a drug resistance gene; a gene responsible for a detectable phenotype of the *Drosophila melanogaster*; and a synthetic splicing donor site,

15 20 which method comprises the steps of:

- (a) introducing the vector into the genome of a white minus fly;
- (b) selecting primary transformants resistant to a drug;
- (c) crossing the primary transformants with a transposase source strain to force the vector to jump into other locations;
- (d) selecting secondary transformants by picking up the flies having strong eye color;
- (e) crossing the secondary transformants with UAS (Upstream Activator Sequence)-luciferase harboring strain and measuring

30

the reporter gene expression of the resultant flies; and
(f) identifying the trapped gene by cloning and sequencing
the cDNAs fused to the reporter gene and the gene responsible
for a detectable phenotype of the fly.

5

11. The method according to claim 10, wherein the
recombinant plasmid is derived from pCasper3.

10 12. The method according to claim 10 or 11, wherein the
reporter gene in the vector is the Gal4 gene, and in the step
(e) the Gal4 expression is measured.

15 13. The method according to claim 10 or 11, wherein the
reporter gene of the vector is the Gal4-firefly luciferase
fusion gene, and in the step (e) expression of said fusion
gene is measured without crossing the secondary transformants
with UAS-luciferase harboring strain.

20 14. The method according to any one of claims 10 to 14,
wherein the gene responsible for a detectable phenotype of
the *Drosophila melanogaster* is mini-white gene, and in the
step (f) the cDNAs fused to the reporter gene and the mini-
white gene are cloned and sequenced.

25 15. The method according to any one of claims 10 to 15,
wherein the drug resistance gene is neomycin-
phosphotranspherase gene and its promoter is a heatshock
promoter, and in the step (b) the transformants resistant to
G418 is selected.

30 16. A method for trapping an unknown gene of *Drosophila*

25 17

melanogaster by using a vector A which is a recombinant plasmid comprising the following nucleotide sequences in this order:

an artificial consensus splicing acceptor site;

5 a synthetic "stop/start" sequence;

Gal4 DNA binding domain-P53 fusion gene as a reporter gene;

a drug resistance gene;

a gene responsible for a detectable phenotype of the *Drosophila melanogaster*; and

10 a synthetic splicing donor site,

and a vector B derived from pCasperhs, which has the heatshock promoter directed Gal4 activator domain-large T antigen fusion gene within polycloning site of the pCasperhs, which method comprises the steps of:

15 (a) introducing each of the vectors A and B into the genomes of separate white minus flies;

(b) selecting primary transformants for the vector A which are resistant to a drug, and selecting primary transformants for the vector B which have an eye color;

20 (c) crossing the primary transformants for the vector A with a transposase source strain to force the vector to jump into other locations;

(d) selecting secondary transformants for the vector A by picking up the flies having strong eye color;

25 (e) crossing the secondary transformants with the primary transformants for the vector B to obtain flies harboring both the vectors A and B;

(f) crossing the flies obtained in the step (e) with an UAS-luciferase harboring fly strain and measuring the reporter gene expression of the resultant flies after a

26.18

heatshock treatment; and

(g) identifying the trapped gene by cloning and sequencing the cDNAs fused to the reporter gene and the gene responsible for a detectable phenotype of the fly.

5

17. The method according to claim 16, wherein the vector A is derived from pCasper3.

10 18. The method according to claim 16 or 17, wherein the gene responsible for a detectable phenotype of the *Drosophila melanogaster* is mini-white gene, and in the step (g) the cDNAs fused to the reporter gene and the mini-white gene are cloned and sequenced.

15 19. The method according to any one of claims 16 to 18, wherein the drug resistance gene is neomycin-phosphotransferase gene and its promoter is a heatshock promoter, and in the step (b) the transformant resistant to G418 is selected.
